

Two-Factor Authentication (2FA) Setup Guide

Overview

Two-factor authentication adds an extra layer of security to your account by requiring a one-time code in addition to your password. We support TOTP authenticator apps (Google Authenticator, Authy) and SMS-based codes.

Enabling 2FA

1. Go to Account Settings > Security > Two-Factor Authentication.
2. Choose either 'Authenticator App' or 'SMS'.
3. For Authenticator App: scan the displayed QR code with your app and enter the 6-digit code to confirm.
4. For SMS: enter your phone number and confirm the code sent via text.
5. Save your 10 backup codes in a secure location; each backup code can be used once if you lose access to your device.

Losing Access to Your 2FA Device

If you lose access to your authenticator app or phone number, use one of your saved backup codes to log in, then immediately reconfigure 2FA with a new device under Security settings. If you have no backup codes remaining, this requires identity verification by a human support agent before 2FA can be reset, since it is a high-risk account security change.

Disabling 2FA

2FA can be disabled from the same Security settings page, but requires re-entering your current password and a valid 2FA code as confirmation.

Recommended Practice

We strongly recommend using an authenticator app over SMS, as SMS can be vulnerable to SIM-swapping attacks. Enterprise accounts may enforce mandatory 2FA for all team members via Admin Settings.
